- Problem Statement

Introduction:

This case is about a bank which has a growing customer base. Majority of these customers are liability customers (depositors) with varying size of deposits.

The number of customers who are also borrowers (asset customers) is quite small, and the bank is interested in expanding this base rapidly to bring in more loan business and in the process.

earn more through the interest on loans. In particular, the management wants to explore ways of converting its liability customers to personal loan customers (while retaining them as depositors).

Age Customer's age

Experience Number of years of professional experience

Income Annual income of the customer

ZIPCode Home Address ZIP code

Family Family size of the customer

CCAvg Average spending on credit cards per month

Education Education Level. 1: Undergrad; 2: Graduate; 3: Advanced/Professional

Mortgage Value of house mortgage if any

Securities Account Does the customer have a securities account with the bank?

CD Account Does the customer have a certificate of deposit (CD) account with the bank?

Online Does the customer use internet banking facilities?

CreditCard Does the customer uses a credit card issued by UniversalBank?

Personal Loan Did this customer accept the personal loan offered in the last campaign?

- The age column has a range of 23 to 67 years old. The mean age is 45 years old.
- The experience column has a min value of -3 and it is possible that there are many such values which need to be handled. But has a average value of 20 years of experience. (Further in our exploration, we will find that experience has a high correlation to age).
- The average income is 73.7 and the max value is more than 3x of the average income of 224.0.
- The rest of columns don't tell us much about the data. We will explore them in depth in the following sections.

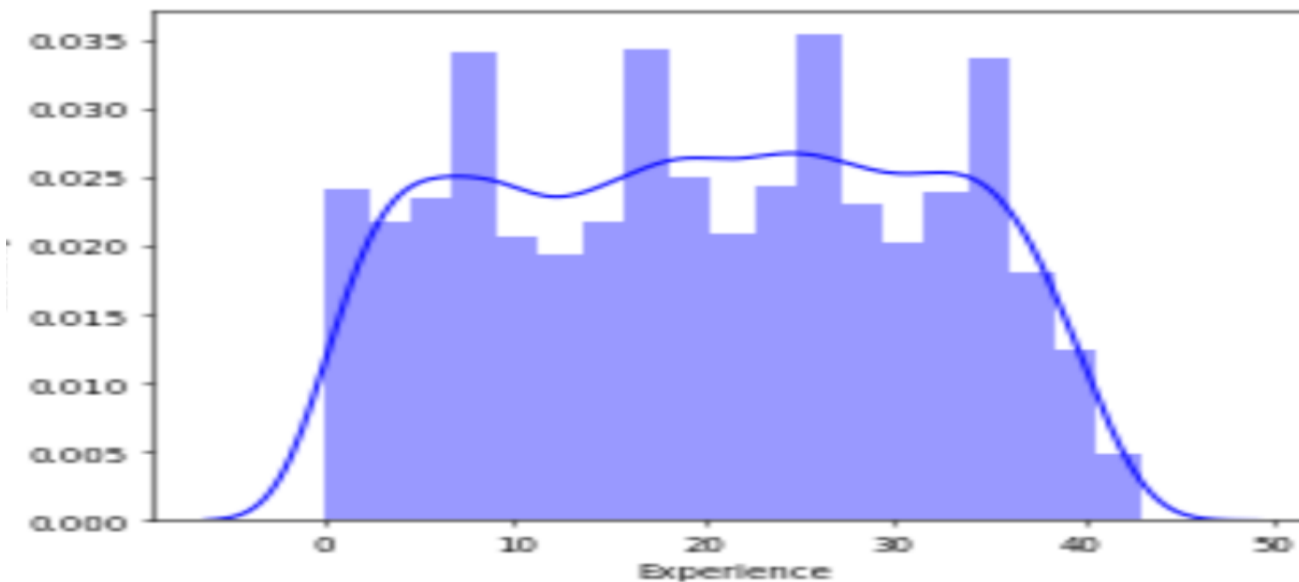

```
count    5000.000000
mean      20.104600
std       11.467954
min       -3.000000
25%       10.000000
50%       20.000000
75%       30.000000
max       43.000000
```

--

```
count    5000.000000
mean      20.134600
std       11.415189
min        0.000000
25%       10.000000
50%       20.000000
75%       30.000000
max       43.000000
```

--

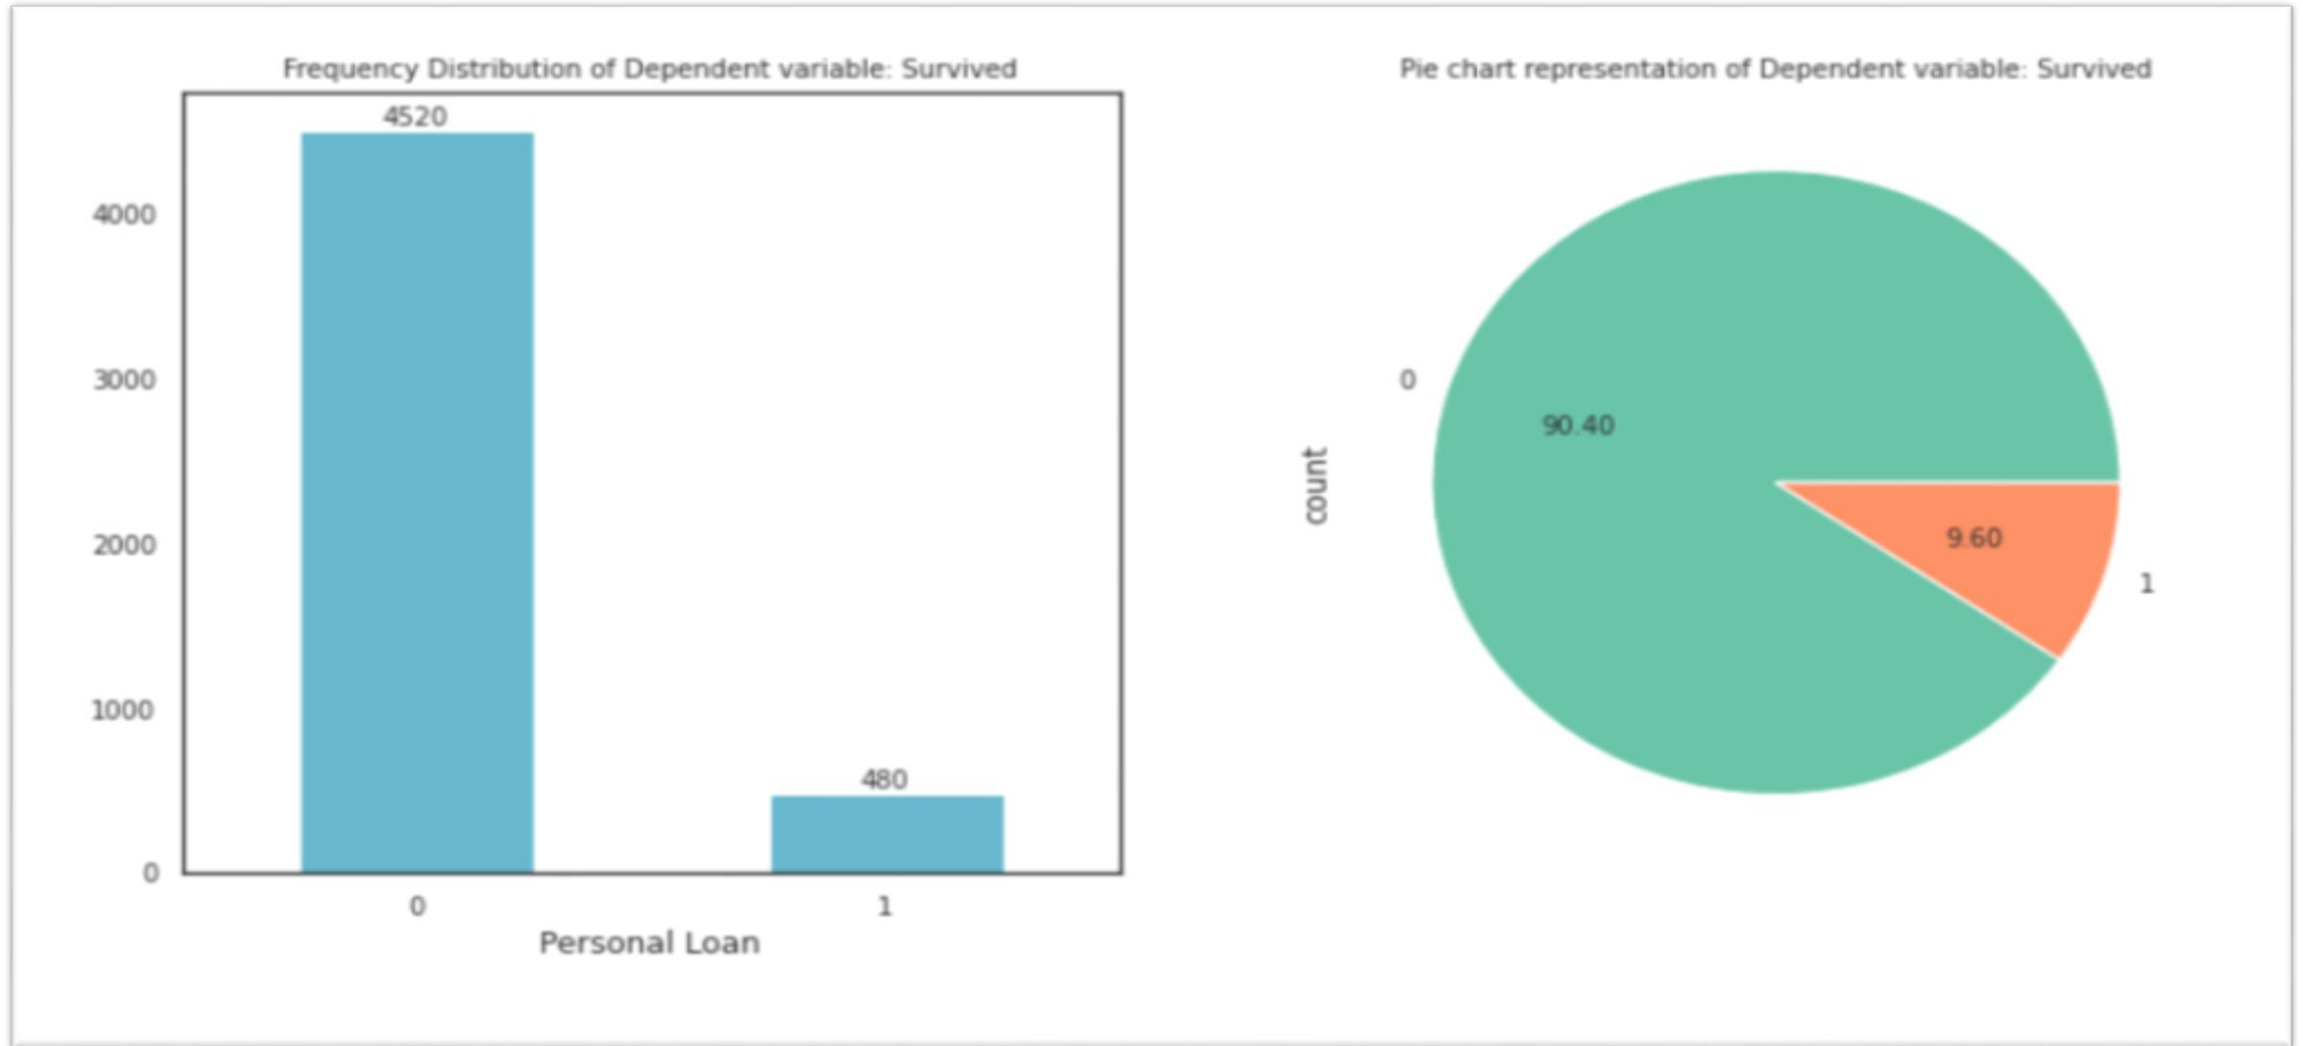

- Income and CCAvg is moderately correlated.
- Age and Experience is highly correlated

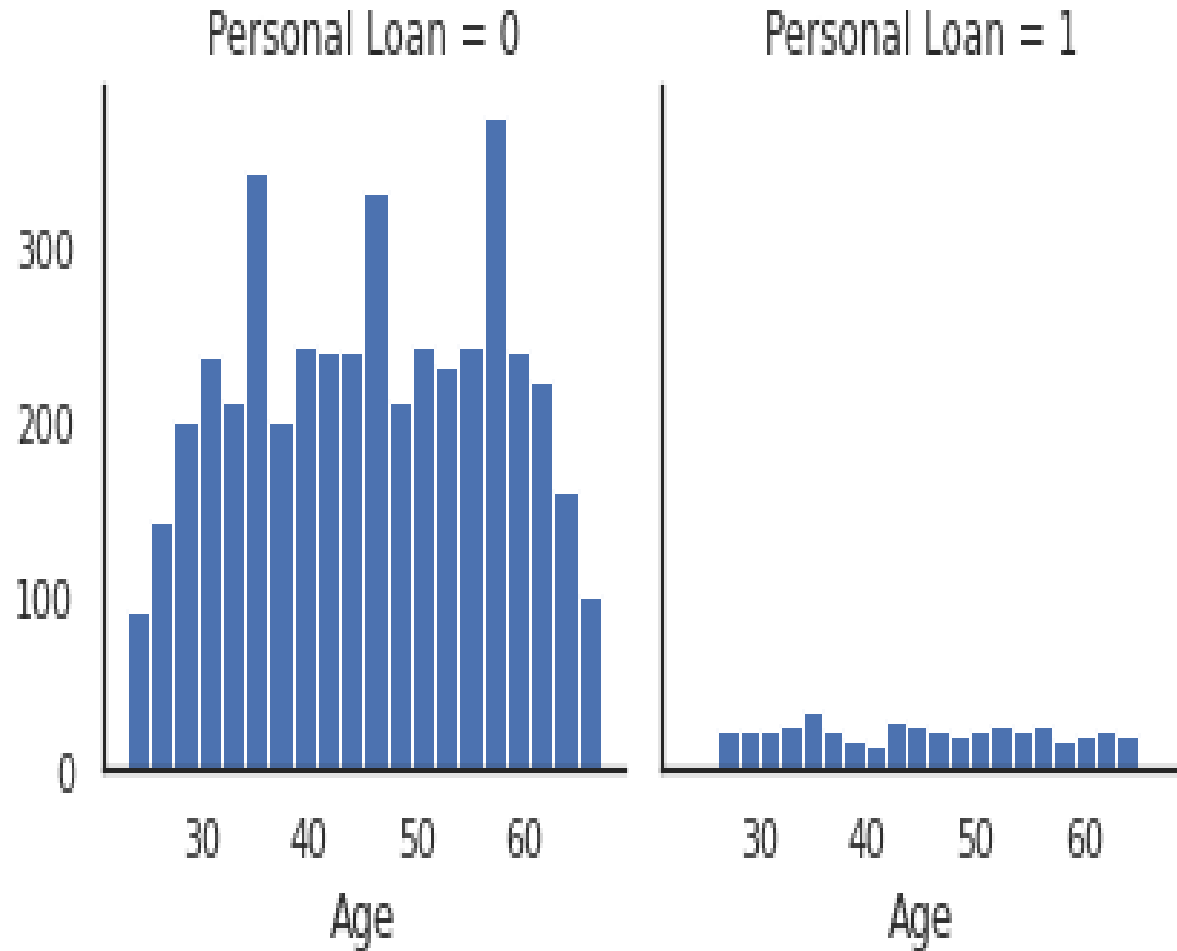

Data Visualization

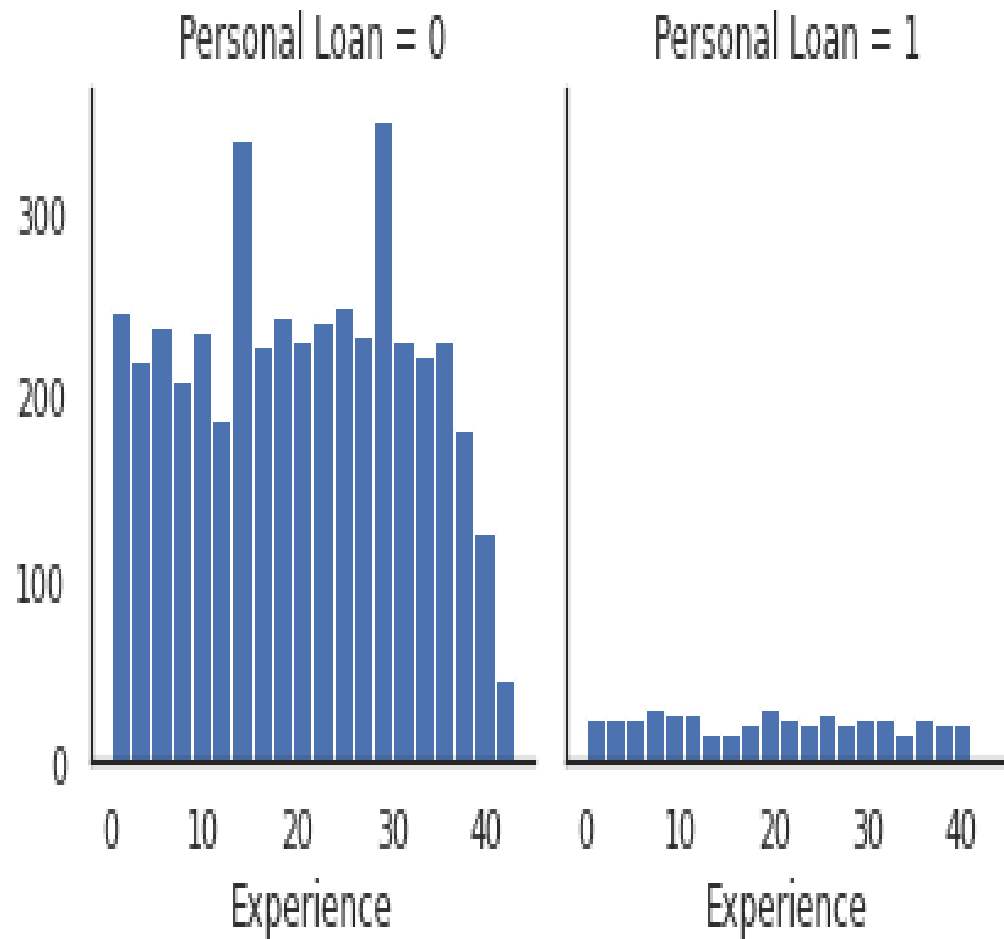

Dataset is likely to be imbalanced dataset. There ratio of Opted Personal Loan vs not opted is less than 90:10. We may need to find out a way to balance those 2 class.

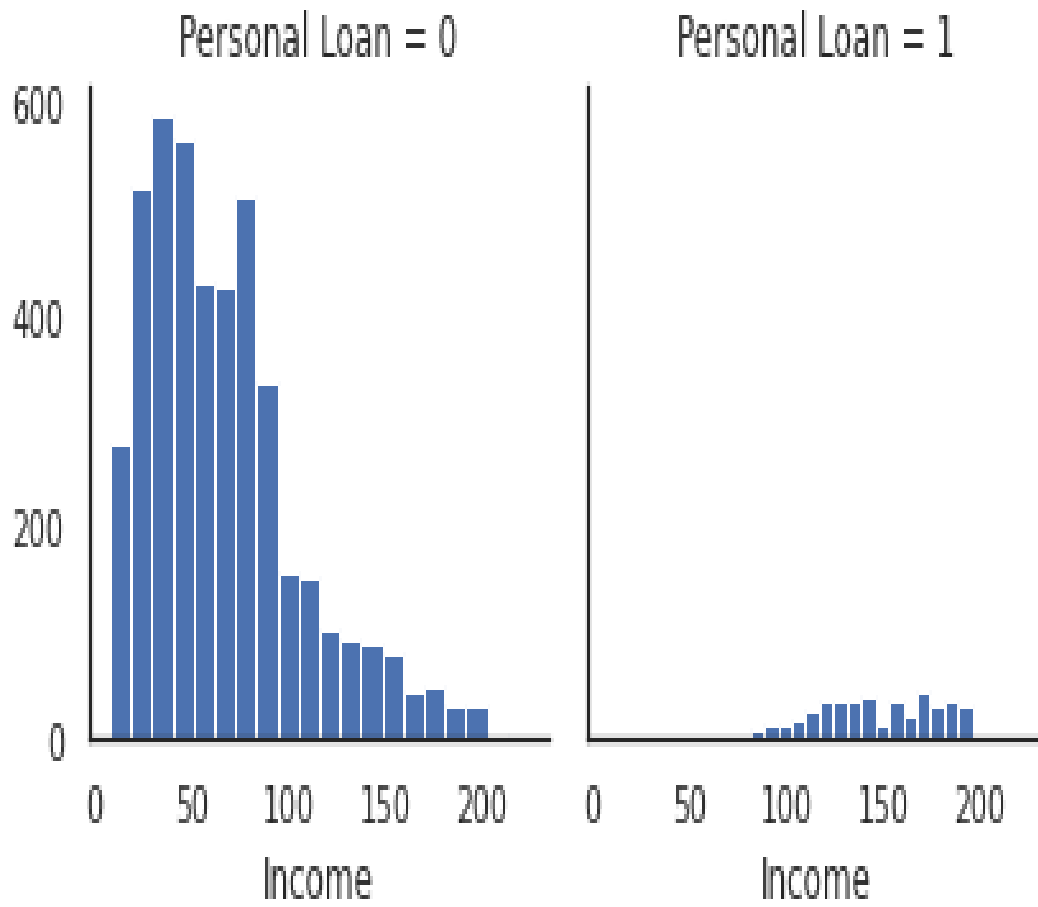

Age can be a vital factor in borrowing loan, converting ages to bin to explore if there is any pattern.

Experience is also normaly distributed.

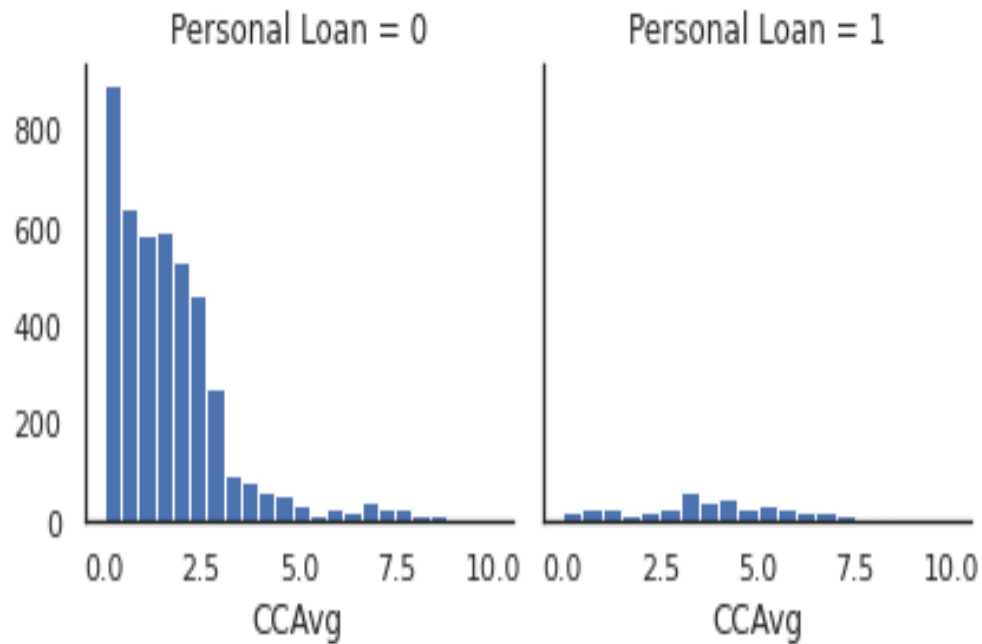

Value is slightly high and hence right skewed as shown in the plot above.

- Above distribution is right skewed distribution because the tail goes to the right
- Most of the customers do not have mortgage
- Customer having 0 Mortgage had high rejection rate.

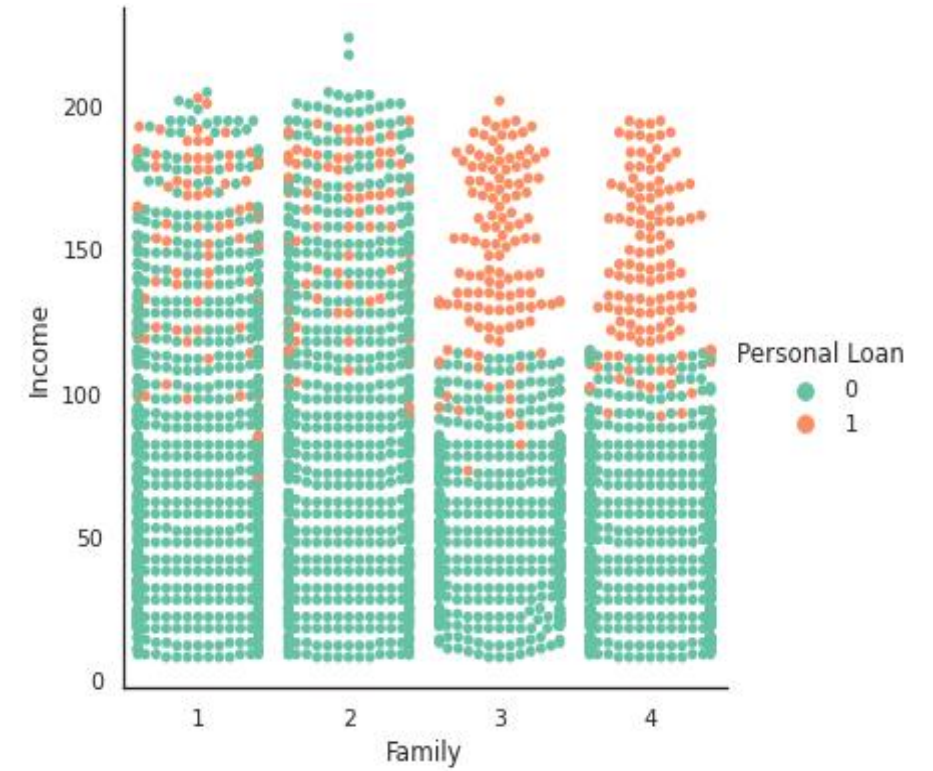

-The above distribution is right skewed distribution because the tail goes to the right
-Customer having low CCAvg mostly rejected Personal loan offer. Customer having CCAvg between 2.5 to 5 has higher rate of acceptance of the offer.

Family Piechart

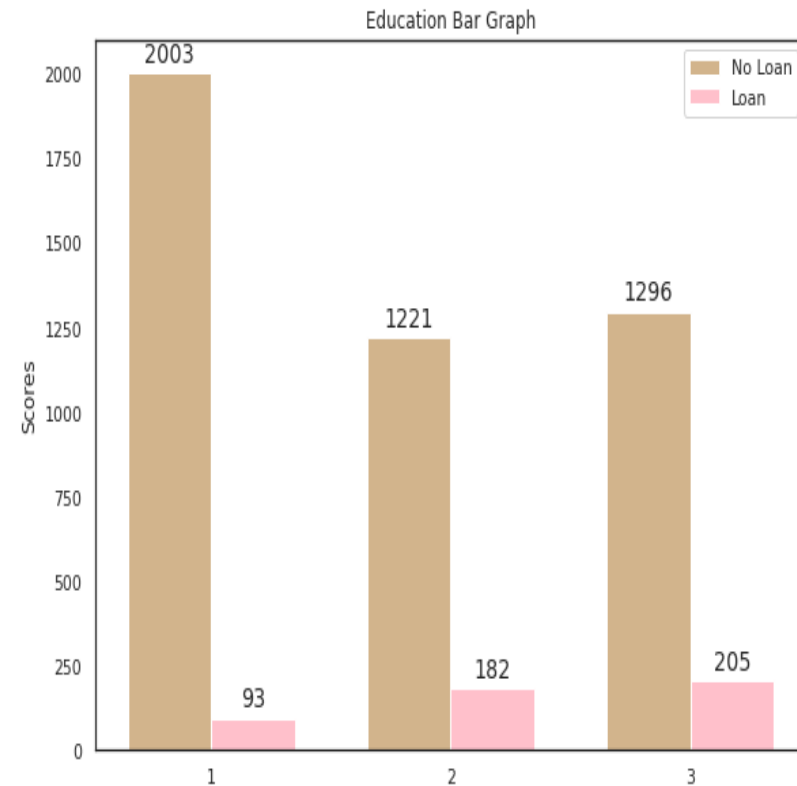

Family Bar Graph

- Family size does not have any impact in personal loan. But it seems families with size of 3 and 4 are more likely to take loan.
- Customers who have family size 3 or greater with higher income between 100k to 200k are more likely to take loan.

From above we can say that customers with undergraduate level of education and family greater than 3 are good customers who took loan. Customer who took loan have same income range irrespective of education level. Education of Graduate and above have more chance to take loan.

Online Piechart

Online Bar Graph

Number of customers who have Online account is greater than the number of customers who do not have online account .

Securities account Piechart

Securities account Bar Graph

Customers who has securies account are more likly to take loan. Majority of customers who does not have loan do not have securities account.

Cd account Piechart

Cd account Bar Graph

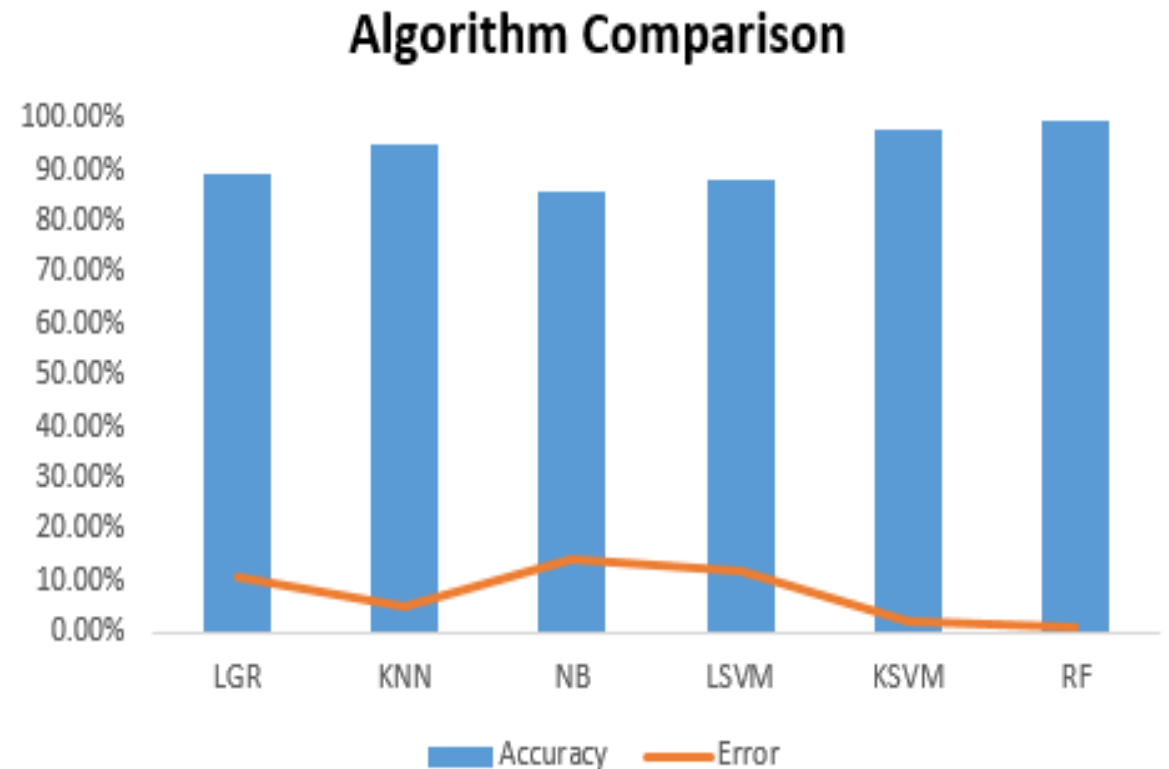

**Customers who does not have CD account , does not have loan as well.
This seems to be majority. But almost all customers who has CD account has loan as well**

Machine Learning Model

	Accuracy	Error
Logistic Regression	: 89.38%	10.62%
KNN	: 94.87%	5.125%
Naive Bayes	: 85.73%	14.27%
Linear SVC	: 88.2%	11.8%
Kernel SVM	: 97.82%	2.176%
Random Forest	: 99.26%	0.7375 %

Problem Statement:

Based on the previous analysis of the data, it was found that the percentage of loan acceptance by the customer is for those whose income is more than or equal to 100k although the analysis showed a number of those whose income is less than 100 k.

So the following must be done:

1- Restructuring the strategic plan in the Marketing Department and providing support for those whose income is less than 100 K.

2- The marketing department coordinates between all customer service departments until it is confirmed that the set plan will be implemented.

3- After that the role of the sales department is but before that the bank management must ensure that all the sales department employees possess communication skills and emotional intelligence.

4- The sales department communicates with the customer in several ways which he determines according to the situation and according to the situation of the customer.

Thank you
